WARNING: Mornation on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

This collection of information is required by 37 CFR 1.17 and 1.27. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completion this form, call 1-800-PTO-9199 (1-800-788-9199) and select option 2.

#### A. Brief summary of the invention

A set of modular control panels bringing control of audio mixing, video switching and effects, and external device functions to the hands of a single user. This level of control concentration by a single individual is made possible by software that constantly redefines the function and/or devices controlled by the buttons, faders, switchers, positioner, knobs, and all other physical controls on the panel(s) to coincide with the sources, effects, functions etc. required at that particular instant in a live television production. Contrariwise, the panel also allows the user single-button access to pre-stored multiple-device selections, effects, and functions to enable production flexibility to deal with unexpected events.

B. Keywords: list keywords or combinations of keywords to guide patent and literature searches.

Underline the most important keywords:

Switcher, Mixer, Automation, E-MEM, GPI, PVTV

### C: Brief discussion of the problem solved by the invention:

Existing systems for single-user control of live productions require the user to reach for a touchscreen and/or mouse for all control and configuration functions. This is undesirable because the hand-eye coordination required for using a graphic user interface removes the user's attention from the program script and the video monitors. A physical panel with tactile controls allows direct hand control in a manner not dissimilar from touch-typing, such manner already being familiar to operators of video switchers and audio mixers.

D: Discussion of how you or others have implemented similar things in the past including the same manner in which others have attempted to solve the problem. Roin tout disadvantages and weaknesses in previous practice. Include literature references where available.

This is a new area of endeavor. There are two existing systems for supplying a single point of control for live production operations. ParkerVision's PVTV system has no

physical user interface device, and Ross Video's OverDrive production control system utilitizes a traditional video switcher control panel.

E. Description of the invention, including one or more practical embodiments of the invention in sufficient detail to allow one with ordinary skill in the art to practice the invention. Include schematic(s), flow chart(s) and or figures to clarify operation of the invention. Point out important, features and items you believe to be new. State advantages of the invention and sacrifices, if any, made to achieve these advantages. Describe any experiments conducted and the results of those experiments.

The invention is a combination of software and hardware through which a single physical control panel (possibly segmented into discrete modules for video switching, audio mixing, and/or device control) offers a user the ability to control all the audio and video production devices required for a complex live television broadcast including but not limited to video switchers, audio mixers, video and audio servers, video and audio routers, character generators, still stores and clip players, camera CCUs, camera robotics, and lighting controllers. The necessary element in making this wide variety of control feasible within a panel of sufficient physical simplicity and accessibility to allow control by no more than one user is the ability to change the functions of the various controls on the panel according to the context of the production at any given instant.

As an example, it would not be possible for a single human being to synchronously move all of the buttons, faders, joystick positioners, etc. required to do a transition between a studio camera shot with multi-layered video overlays and multiple audio sources open to a remote news live shot using traditional switching and mixing control surfaces. However, if a specialized panel is configured by software to simultaneously trigger movement of audio faders, re-selection of video switcher sources and effects, output content of character generators and still stores, etc. by assigning all of those synchronous activities to a single control, the user need only actuate that control. The invention expands on simple "yes/no" logic in such actuation by allowing the user to retain elements from the previous on-air configuration and/or "pre-use" elements from an upcoming on-air configuration.

The drawing in Attachment 1 depicts one possible configuration for such a panel: the rightmost portion of the drawing contains a subpanel used for device control. The top portion of that subpanel is camera control. Software determines which camera is under control of the positioner and knob controls at any given moment and also lights LED displays informing the user of which camera is currently in use and which is next to be used. The user may adjust the on-air camera with the positioner and knob controls or select any other camera to adjust by pressing the appropriately labeled

button. None of these actions have any bearing on which camera is actually being taken to air. The button field below the camera controls allow the user to manually trigger playout of software staged character generator and/or still store events or to call upcoming or previous events and trigger playout of them. In this area the user is also able to choose whether to take the event to air instantaneously or through the means of some pre-configured effects such as a character generator typing out letters individually.

The center section of the panel provides the user a means to monitor and adjust the levels of the audio sources required by the production at any given moment as assigned by software as well as to monitor and adjust the master output audio level. Motorized faders are positioned by the software but such positioning can be overridden when the fader is moved by a human hand. The button field above the faders allows the user to select source(s) to be preserved from the current mix to the next one required by software as well as to open source(s) from the next mix while the current mix is still being used.

The leftmost section of the panel is used to apply human timing and esthetic sense to the progression through the software defined configurations used in the production. In the example cited above, the transition from the complex studio shot to the news remote would be accomplished simply by pressing the "take" button. Unlike in traditional switchers, this may or may not trigger a video "take". Indeed, if the software configurations call for it, pressing the take button may trigger a complex auto-trans video mix with multiple key frames, playing one or more audio and/or video server channels while stopping playout on others, cross-fading multiple audio sources, etc. The button field occupying most of this panel allows the user to select from a group of pre-defined software configurations and force one or more of them to air to deal with unexpected production events such as breaking news storage.

The drawing in Attachment 2 provides an example of the underlying physical architecture required to realize such panel functionality, and Attachment 3 describes how such a panel would relate to other physical and logical devices involved in the production.
